CLAIMS

Amend the claims as follows.

1. - 6. (Canceled)

greater than 20 kHz;

 (Previously presented) A cochlear implant system for a patient's cochlea comprising:

at least one electrode for electrical coupling with the patient's cochlea; an internal coil for implanting in the patient to drive the at least one electrode; a microphone for outputting electrical sound signals in response to external sounds; an oscillator for generating an electrical analog carrier signal having a frequency

a modulator for modulating the carrier signal with the sound signals to generate a modulated signal; and

an external coil for magnetically coupling the modulated signal to the internal coil such that the modulated signal is electrically directly applied to the cochlea to cause a percept.

- (Original) The system of claim 7, wherein the modulator is an amplitude modulator.
- (Original) The system of claim 7, wherein the modulator is a frequency modulator.
- (Original) The system of claim 7, wherein the electrical analog carrier signal has a frequency of at least 32 kHz.
- (Original) The system of claim 10, wherein the modulator is an amplitude modulator.
 - 12. (Original) The system of claim 10, wherein the modulator is a frequency modulator.

- 13. (Previously presented) The system of claim 7 comprising at least one reference electrode for providing a reference voltage to the at least one electrode.
- 14. (Previously presented) The system of claim 14 wherein the modulated signal allows a wearer of the implant system to hear frequencies higher than air-conducted sonic human hearing sensitivity.
- 15. (New) The system of claim 13 where the internal coil includes a first terminal for connecting to the at least one electrode and a second terminal for connecting to the at least one reference electrode.
